Possible urinary signs & symptoms | The outcome | Recommended care | COVID-19 specific advice
---|---|---|---
**Key signs/symptoms:**
- Dysuria: Burning pain when passing urine (wee)
- New nocturia: Needing to pass urine in the night
- Cloudy urine: Visible cloudy colour when passing urine

**Other signs/symptoms to consider:**
- Frequency:
- Haematuria: Blood in your urine
- Suprapubic pain: Pain in your lower tummy

**Other things to consider:**
- Inflammation due to sexual activity can feel similar to the symptoms of a UTI
- Some sexually transmitted infections (STIs) can have symptoms similar to those of a UTI

**Changes during menopause**
- Some changes during the menopause can have symptoms similar to those of a UTI
- Topical hormonal treatment may help; antibiotics less likely to help

**If none or only one of:**
- dysuria, new nocturia, cloudy urine;
- AND/OR vaginal discharge
- UTI much less likely
- You may need a urine test to check for a UTI
- Antibiotics less likely to help
- Usually lasts 5 to 7 days

**Non-pregnant women:**
- Self-care and pain relief.
- Symptoms may get better on their own
- Delayed or backup prescription with self-care and pain relief
- Start antibiotics if symptoms:
  - Get worse
  - Do not get a little better with self-care within 48 hours

**If 2 or more of:**
- dysuria, new nocturia, cloudy urine; OR bacteria detected in urine; AND NO vaginal discharge
- UTI more likely; antibiotics should help
- You should start to improve within 48 hours
- Symptoms usually last 3 days

**Pregnant women:**
- Always request urine culture
- If suspected UTI

**Common symptoms of COVID-19 to look out for:**
- A loss of, or change to your sense of smell or taste
- A high temperature
- A new continuous cough

**If you have any of these symptoms and think you may have a UTI please do not ignore the UTI symptoms.**
- Book a COVID-19 test and self-isolate for 10 days or until you get a negative test result (www.gov.uk/get-coronavirus-test) AND

Follow the latest advice on COVID-19 at www.gov.uk/coronavirus and www.nhs.uk

---

**Self-care to help yourself get better more quickly**
- Drink enough fluids to stop you feeling thirsty. Aim to drink 6 to 8 glasses
- Avoid too much alcohol, fizzy drinks or caffeine that can irritate your bladder
- Take paracetamol or ibuprofen at regular intervals for pain relief, if you have had no previous side effects
- There is currently no evidence to support taking cranberry products or cystitis sachets to improve your symptoms
- Consider the risk factors in the ‘Options to help prevent a UTI’ column to reduce future UTIs

**Options to help prevent a UTI**
- It may help you to consider these risk factors:
  - Stop bacteria spreading from your bowel into your bladder. Wipe from front (vagina) to back (bottom) after using the toilet.
  - Avoid waiting to pass urine. Pass urine as soon as you need to.
  - Go for a wee after having sex to flush out any bacteria that may be near the opening to the urethra.
  - Wash the external vagina area with water before and after sex to wash away any bacteria that may be near the opening to the urethra.
  - Drink enough fluids to make sure you wee regularly throughout the day, especially during hot weather.

**If you have a recurrent UTI, the following may help**
- Cranberry products and D-mannose: There is some evidence to say that these work to help prevent recurrent UTI
- After the menopause: Topical hormonal treatment may help; for example, vaginal pessaries.
- Antibiotics at night or after sex may be considered

**Antibiotic resistance**
- Antibiotics can be lifesaving. But antibiotics are not always needed for urinary symptoms.
- Antibiotics taken by mouth, for any reason, affect our gut bacteria making them resistant.
- This may make future UTI more difficult to treat
- Common side effects to taking antibiotics include thrush, rashes, vomiting and diarrhoea. Seek medical advice if you are worried.
- Keep antibiotics working: only take them when advised by a health professional. This way they are more likely to work for a future UTI.

**When should you get help?**
Contact your GP practice or contact NHS

The following symptoms are possible signs of serious infection and should be assessed urgently.
- Phone for advice if you are not sure how urgent the symptoms are.
  1. You have shivering, chills and muscle pain
  2. You feel confused, or are very drowsy
  3. You have not passed urine all day
  4. You are vomiting
  5. You see blood in your urine
  6. Your temperature is above 38°C* or less than 36°C
  7. You have kidney pain in your back just under the ribs
  8. Your symptoms get worse
  9. Your symptoms are not starting to improve within 48 hours of taking antibiotics

*Temperature above 38°C is also a symptom of COVID-19. Please see COVID-19 specific advice.
